ABOUT FOCUS ON ENERGY®

Focus on Energy works with eligible Wisconsin residents and businesses to install cost-effective energy efficiency and renewable energy projects. Focus on Energy information, resources and financial incentives help to implement projects that otherwise would not get completed, or to complete projects sooner than scheduled. Its efforts help Wisconsin residents and businesses manage rising energy costs, promote in-state economic development, protect our environment and control the state’s growing demand for electricity and natural gas.

For more information, call 800.762.7077 or visit focusonenergy.com

Focus on Energy makes saving energy and money easy for Wisconsin businesses. Use the information below to help guide your way to savings. For electronic copies of the forms, visit focusonenergy.com/catalogs.

**STEP 1**

**BEFORE YOU APPLY:**
- Verify customer and product eligibility:
  - Confirm your gas and/or electric utilities participate in Focus on Energy at focusonenergy.com/utilities.
  - Read product requirements, both general and technology-specific, in your equipment’s corresponding incentive catalog.
  - Review the Participation Requirements page.
  - Review the Terms and Conditions at focusonenergy.com/terms.
  - View the qualified product lists at focusonenergy.com/business/qpls.
  - Applications exceeding $10,000 can request preapproval. Applications not preapproved may not receive payment if program funds have been exhausted.
- Qualifying products must be installed by December 31, 2020.

**STEP 2**

**WHAT YOU’LL NEED:**
- Incentive Application & Equipment Incentive Catalog(s)
- Gas & Electric Utility Account Numbers
- Tax ID Number
- Invoice showing proof of purchase(s)/installation MUST include:
  - Trade Ally name, address and phone number
  - Itemized list of each product along with manufacturer name, model number, and quantity
  - Itemized purchase price of product/installation
  - Job Site Address
- Reminder: Incentives are capped at 100% of equipment cost unless otherwise noted. Like-for-like equipment replacement due to recall, warranty replacement, etc. is not eligible for an incentive.
- Manufacturer specifications (when required) — MUST include:
  - Full model number
  - Energy performance information
  - Additional documentation (when required)

**STEP 3**

**COMPLETE THIS APPLICATION:**
- All fields on application are required. Incomplete application(s) cannot be processed.
- Complete SECTION 7 with all product information. Use the Incentive Product Information Sheet found at focusonenergy.com/catalogs if you need additional lines.
- Include installation date (date of the last product installed). If project is new construction, use the occupancy date. Project is considered complete when products are installed and operational.
- Complete the catalog-specific Supplemental Data Sheet for applicable measures. An asterisk (*) next to the code indicates when this is needed. Read the measure requirements in your catalog for directions.
- Include the reservation code(s) in SECTION 7 when applicable.
- The utility ratepayer must sign and date SECTION 8.
- Ensure supporting documents are attached, including itemized invoice(s).
- Make a copy of the application and supporting documents for your records.

**STEP 4**

**SUBMIT YOUR APPLICATION:**
Mail or email your application and all supporting documentation. Applications must be submitted within 60 calendar days of completed project installation, no later than January 31, 2021.

**MAIL:**
Focus on Energy
725 W. Park Avenue
Chippewa Falls, WI 54729

**E-MAIL:**
business@focusonenergy.com
PARTICIPATION REQUIREMENTS

NEED HELP? Call 800.762.7077

Use the eligibility requirements below to see if your business qualifies for program incentives. You can also visit focusonenergy.com to find savings opportunities specific to your business.

CUSTOMER ELIGIBILITY

All non-residential customers (agriculture, commercial, government, industrial, multifamily, and schools) located in a participating utility territory are eligible to receive Focus on Energy incentives. To see if your utility participates, go to focusonenergy.com/participating-utilities.

CUSTOM INCENTIVES

Does your project not fit in one of our prescriptive offers? Custom project incentives are calculated on a case-by-case basis for non-standard technologies and are based on estimated first-year energy savings. Whether you operate a large industrial facility, a chain store or franchise, an office, school or municipal building, a farm, or anything in between, we can show you how to be more energy efficient — and how to save on the cost of making improvements.

Before purchasing equipment or proceeding with upgrades, you must contact an Energy Advisor from Focus on Energy. Your Energy Advisor will help you determine if your project qualifies for a Focus on Energy custom incentive and help you obtain necessary pre-approval.

To get started with your custom project, download and complete the Custom Incentive Guide at focusonenergy.com/custom.

NEW CONSTRUCTION

Qualifying projects are new, stand-alone commercial, industrial and multifamily residential facilities, additions to existing facilities, and major renovations due to a change in the use of space (e.g., a warehouse to office). Typical facility types include:

- School facilities (e.g., public and private k-12, technical colleges, colleges, universities)
- Commercial facilities (e.g., banks, hotels, offices, convenience stores/gas stations, manufacturing, brewerries, restaurants)
- Healthcare facilities (e.g., nursing homes/skilled nursing, Community-Based Residential Facilities (CBRF), hospitals)
- Residential properties with four or more dwelling units under one roof (e.g., apartment/condominium buildings, student housing)

New Construction incentives available include Whole Building Design incentives and prescriptive incentives included in this catalog. Reach out to an Energy Advisor from Focus on Energy to help identify what is best for your project.

New Construction measures and incentives will appear in a grey table, while Existing Building measures and incentives will appear in a blue table. If a measure does not have a grey table, New Construction incentives are not offered for that measure.

INFORMATION AND REQUIREMENTS

Before you start your project, make sure you are familiar with participation requirements, program information and Terms and Conditions.

General Terms and Conditions

Review the Focus on Energy Terms and Conditions at focusonenergy.com/terms or call 800.762.7077 to request a copy.

Incentive Limits

Incentives are limited to $300,000 per project and $400,000 per customer per calendar year for all Focus on Energy incentives (prescriptive and custom).

Depending on your business tax classification, you may receive IRS form 1099 for incentives totaling over $600 in a calendar year.

Trade Ally Information

A Trade Ally represents the company who provided/installed the equipment for a project or performed the service for which a Customer is seeking an incentive. Trade Allies who have signed an agreement with Focus on Energy are allowed to enjoy certain program benefits, one of which is to receive direct payment of incentives at the Trade Ally’s request. Incentives can only be paid directly to a registered Trade Ally who has a W-9 on file with Focus on Energy. For more information on becoming a registered Trade Ally, visit focusonenergy.com/tradeally.

The Federal Employer Identification Number (FEIN) and Business Classification of the Trade Ally is required if you received your incentive as a credit on your invoice, whereby the incentive is paid directly to the Trade Ally. In this scenario, the credit must be clearly labeled as the Focus on Energy incentive and deducted from the amount due.

If your project was completed by more than one Trade Ally (example, equipment was purchased from one Trade Ally but installed by another Trade Ally) and the incentive is being paid to you the Customer, enter the information of the Trade Ally who installed your equipment in Section 4: Trade Ally Information. If the equipment was self-installed, enter the information of the Trade Ally from whom you purchased the equipment.

Assignment of Incentives to Other Payee

The Customer for the project site listed on the application may assign their right to participate and receive incentives to Other Payee. The Customer must sign Section 8 and identify the Other Payee in Section 5.
INCENTIVE APPLICATION
FOR PROJECTS COMPLETED BY 12/31/2020

PLEASE COMPLETE ALL SECTIONS. INCOMPLETE APPLICATIONS CANNOT BE PROCESSED AND WILL DELAY PAYMENT OF INCENTIVES. APPLICATIONS MUST BE SUBMITTED WITHIN 60 DAYS OF COMPLETED PROJECT INSTALLATION, NO LATER THAN JANUARY 31, 2021. FOR ADDITIONAL COPIES OF THIS FORM, VISIT FOCUSONENERGY.COM/CATALOGS.

SECTION 1
ACCOUNT AND CUSTOMER INFORMATION
TAX IDENTIFICATION NUMBER (Check one.)
☐ FEIN  or  ☐ SSN

☐ Government  ☐ Grocery/Convenience Store  ☐ Healthcare  ☐ Hotels & Lodging  ☐ Manufacturing (product):
☐ Multifamily  ☐ Office  ☐ Religious Worship  ☐ With K+ Daily Education  ☐ No K+ Daily Education  ☐ Restaurant  ☐ Retail  ☐ Vehicles Sales/Service  ☐ Water/Wastewater  ☐ Other: ________________

INCENTIVE APPLICATION

CUSTOMER SIGNATURE
I, the undersigned Customer or authorized representative of the Customer, agree the stated energy-efficiency measure(s) was (were) installed at the job site address listed above as part of the FOCUS ON ENERGY® Program. I have read and agreed to the provisions set forth herein and to the Terms and Conditions posted at focusonenergy.com/terms. I understand Focus on Energy may revise these Terms and Conditions at any time, and I will not be notified in the event changes are made. To the best of my knowledge, the statements made on this application are complete, true and correct, and I have submitted the appropriate supporting documentation to receive an incentive.

If Other Payee is indicated in Section 5, I, the Customer, attest I am the ratepayer (utility account holder) for the site(s) listed in Section 2, and I assign the right to participate in and receive incentives from the Focus on Energy Program to the Other Payee identified in Section 5.

CERTIFICATION: The following certifications are required in order for this form to substitute for the Internal Revenue Service (IRS) form W-9. Under penalty of perjury, I certify that:

☐ If Dairy, how many milking cows do you have (includes dry cows; excludes heifers not yet fresh)?: _______
☐ I have read and agree to the provisions set forth therein and to the Terms and Conditions posted at focusonenergy.com/terms.
☐ I understand Focus on Energy may revise these Terms and Conditions at any time, and I will not be notified in the event changes are made.
☐ The statements made on this application are complete, true and correct.
☐ I have submitted the appropriate supporting documentation to receive an incentive.
☐ If Other Payee is indicated in Section 5, I, the Customer, attest I am the ratepayer (utility account holder) for the site(s) listed in Section 2, and I assign the right to participate in and receive incentives from the Focus on Energy Program to the Other Payee identified in Section 5.
☐ The number shown on this form is the correct taxpayer identification number.
☐ I am not subject to backup withholding because: (a) I am exempt from backup withholding, or (b) I have not been notified by the IRS that I am subject to backup withholding as a result of failure to report all interest or dividends, or (c) the IRS has notified me that I am no longer subject to backup withholding.
☐ I am a U.S. person.

The IRS does not require my consent to any provision of this document other than the certifications required to avoid backup withholding.

Submit applications to:
MAIL: Focus on Energy
725 W. Park Avenue
Chippewa Falls, WI 54729
E-MAIL: business@focusonenergy.com

*Incentive may be adjusted based on project caps. See measure requirements and Terms and Conditions for more information.
### HOW TO FILL OUT THIS FORM

Please refer to:
- The Process Systems Incentive Catalog for measure requirements and information.
- Complete the table corresponding to the measure in the catalog.

Attach this form to a completed Incentive Application and submit together.

COMPRESSED AIR AND VACUUM PUMPS
General Requirements: A survey log must accompany the incentive application.

COMPRESSED AIR LEAK SURVEY AND REPAIR

Requirements:

- Complete Table A of the "Process Systems Catalog Supplemental Data Sheet" for this measure.
- Incentive is per HP of connected air compressors in the system, not per CFM of leak identified. In the total HP for the incentive, only include lead and trim air compressors that normally run during plant operation; do not include the HP for any dedicated backup air compressors.
- Customer must repair at least one leak for every five connected compressor HP. If less than one leak per every five HP is identified, then all leaks identified must be repaired. In the case where all identified leaks must be repaired, customer may provide written explanation for a leak that cannot be repaired and may still qualify for the incentive.
- Leaks must be repaired before application is submitted and Focus on Energy must receive the application within 120 days of leak survey completion date.
- Customers must leave leak tags in place for at least four months after application is submitted to allow Focus on Energy to verify leak repair if needed.
- Party receiving incentive is responsible for verifying required number of leaks repaired for incentive eligibility.
- This incentive is only available once per 12-month period, per customer site.
- A leak log in the form of a spreadsheet must be submitted with the completed incentive application. The following data must be recorded for each leak: tag number, location, description, leak dB reading, estimated cost of leak ($/year) and repaired (yes/no).
- Incentive is eligible for up to 100% of survey and repair costs with a maximum incentive of $4,000 per year.

* Supplemental Data Sheet needed

PRO TIP

Compressed air leaks can waste 20%-30% of the compressor's output. Leaks can also cause problems with the compressed air system such as excess compressor capacity, fluctuating system pressure and shortened equipment life.
**AIR COMPRESSORS AND VACUUM PUMPS**

**General Requirements:** Variable speed drive (VSD) air compressors and vacuum pumps are best suited for trim operation and in single compressor air systems that have varying load because they have efficient part-load performance.

**VSD AIR COMPRESSORS**

**Requirements:**
- Complete Table B1 and B2 of the "Process Systems Catalog Supplemental Data Sheet" for this measure.
  - List all existing compressors on the Supplemental Data Sheet, including compressors that will not be modified as part of the project.
  - Existing compressors being replaced by the VSD compressor should indicate "Removed" or "Emergency Back-Up" for "Use After."
  - Existing compressors needed to meet the per-shift airflow requirements that will continue being used should indicate "Remain in Operation" for "Use After."
- Submit manufacturer specification sheets and/or a CAGI sheet at anticipated operating pressure for items installed. If available, submission of specification sheets for the removed compressor will expedite processing of your application.
- Must be variable speed rotary vane compressor or variable speed screw compressor and operate a minimum of 2,000 hours annually to be eligible.
- Air compressors purchased or installed for backup or redundant systems do not qualify.
- This is for new VSD compressors only; adding a VSD to an existing compressor does not qualify. Replacing an old VSD compressor with a new VSD compressor does not qualify. Adding a VSD compressor to a system that already includes a VSD compressor does not qualify.
- Replaced equipment must be removed. If an old compressor replaced by a VSD compressor remains connected as emergency backup, by signing the application, the customer is attesting that the old compressor will be used only in case of emergency and will rarely (if ever) operate.
- Limited to one VSD compressor per compressed air system. Compressed air systems with large-load variations requiring multiple VSD trim compressors may contact Focus on Energy at 800.762.7077 to request a variance.

---

<td>HP</td>
</tr>
</tbody>
</table>

* Supplemental Data Sheet needed

---

**PRO TIP**

Allowing a VSD compressor to handle the trim loads not only allows that compressor to operate efficiently, it also allows the other compressors in the system to be base loaded and run as efficiently as possible.
VSD VACUUM PUMPS

Requirements:
- Complete table F (for variable torque) or table G (for constant torque) of the "Process Systems Incentive Catalog Supplemental Data Sheet" for this measure.
  - For the VFD Application column, enter Vacuum Pump.
  - For the Controls Before VFD column, enter Inlet Control Valve, On/Off, or Other and then describe.
  - For Controls After (Constant Torque vacuum pumps only), enter Automatic or Manual.
- VSD vacuum pumps are limited to ≤ 30 HP. Custom incentives may be available for VSD vacuum pumps > 30 HP.
- Vacuum pumps must operate a minimum of 2,000 hours annually to be eligible.
- Variable torque vacuum pumps are non-positive displacement pumps, including centrifugal blowers and regenerative blowers.
- Constant torque vacuum pumps are positive displacement pumps, including reciprocating piston, diaphragm, rocking piston, rotary vane, liquid ring, rotary screw, and lobed rotor pumps.
- Submit manufacturer specification sheet showing the type of vacuum pump that was installed.
- Vacuum pumps purchased or installed for backup or redundant systems do not qualify.

* Supplemental Data Sheet needed

**PRO TIP**

Dry air is important for your compressed air system to operate smoothly. However, drying air below the dew point required for the specific operation will cause the dryer to work harder, increasing your operating cost.
CYCLING REFRIGERATED AIR DRYERS

Requirements:
• New dryers must be properly sized to meet the needs of the compressed air system.
• New dryers must be cycling or variable frequency drive (VFD)-controlled refrigerated dryers replacing non-cycling refrigerated dryers. The replacement of desiccant, deliquescent, heat-of-compression, membrane or other types of dryers are not eligible.
• Installation of controls to existing dryers does not qualify for an incentive.
• For new construction, cycling refrigerated dryers must be installed instead of non-cycling refrigerated dryers.
• Controls-based efficiency projects and/or the replacement of other dryer types may qualify for a custom incentive.

DEWPOINT DEMAND CONTROLS FOR DESICCANT DRYERS

Requirements:
• Complete table C of the "Process Systems Incentive Catalog Supplemental Data Sheet" for this measure.
  • For Hours of Operation, enter the total hours per year the vacuum pump operates.
  • For Air Compressor Type, enter single-acting reciprocating, double-acting reciprocating, single stage rotary screw, two-stage rotary screw, oil-free rotary screw, centrifugal, or other.
  • For Air Compressor Control Type, enter Variable Speed Drive, Load/Unload, Inlet Modulating Damper, or Variable Displacement.
  • For Desiccant Dryer Type, enter Heatless, Heated, or Blower Purge.
  • Dryer controls are only for use on heatless, heated, or blower purge desiccant dryers.
  • Dryer must have a dew point sensor at discharge to monitor demand.
  • Dryer controls must control the regeneration process based on actual dewpoint instead of regenerating based on time alone.
  • Incentive is per CFM of dryer capacity.
  • Dryer controls are not eligible for backup/redundant desiccant dryers.
  • Use the smaller CFM value between dryer and air compressor when applying for the incentive.

**NO AIR-LOSS CONDENSATE DRAINS**

**Requirements:**
- Must be used in systems with load/no-load, variable speed, variable displacement or centrifugal compressors.
- Load/no-load system must have adequate storage for drains to be eligible.
- Manual drains, lever-operated mechanical drains or solenoid drains are not eligible for incentives.
- The replacement drain must be "no air-loss," meaning it must continuously measure the presence of condensate, purge it only when necessary and only long enough to prevent the unintentional purging of compressed air.
- If no air-loss condensate drain is integral to another piece of equipment (i.e., is part of the air compressor, air dryer, mist eliminator, etc.), provide a manufacturer's specification sheet to confirm.
- Replacement of existing no air-loss condensate drains does not qualify.

</table>

**COMPRESSED AIR MIST ELIMINATORS**

**Requirements:**
- Compressed air system HP must be ≥50 HP.
- The mist eliminator must have an initial pressure drop of 1 psig or less.
- For existing buildings, the mist eliminator air filter must replace a standard coalescing filter.
- For new construction, a mist eliminator air filter must be installed instead of a standard coalescing filter.

</table>
General Requirements: Applies to heat recovery for the offset of space heating provided by natural gas-fired heating equipment only. Systems that offset the use of propane, oil, electricity, etc., do not qualify. Heat recovery systems that offset natural gas-fired process heating equipment may qualify for a custom incentive.

**COMPRESSED AIR AND VACUUM SYSTEM HEAT RECOVERY**

Requirements:
- Heat recovery system must include automatic controls to switch from winter to summer operation. Systems with only manual damper controls are not eligible.
- Heat recovery systems installed for backup or redundant air compressors or vacuum pumps do not qualify.
- The project must result in an estimated net reduction of BTUs consumed in the facility to be eligible.
- This incentive is for the installation of a new heat recovery system where one did not exist previously. Replacing an existing heat recovery system or upgrading an existing heat recovery system from manual to automatic controls does not qualify.
- The static pressure in the area where the compressor or vacuum pump is enclosed must remain the same.
- If outside air is used in the system, antifreeze protection must be considered.
- Incentive is limited to 50% of the project cost.

<td>$50</td>
<td>HP</td>
</tr>
<tr>
<td>Vacuum Pump Heat Recovery</td>
<td>N-PS3928</td>
<td>$50</td>
<td>HP</td>
</tr>
</tbody>
</table>

**PRO TIP**

As much as 80%-93% of a compressor’s electrical energy is converted into heat. Installing heat recovery can then put 50%-90% of that generated heat to good use. Installing automatic damper controls ensures that recovered heat is used to its fullest potential even during transition months when some days require heating and some require cooling. It also ensures that energy savings are not dependent on staff maintaining manual controls.
COMPRESSED AIR LOAD SHIFTING

Requirements:

- Complete Table D of the "Process Systems Catalog Supplemental Data Sheet" for this measure.
  - For the "Total HP" enter the total HP of the existing air compressor(s) and the facility that serve the inappropriate compressed air use.
  - For the "Airflow (CFM) @ Pressure (PSI)," enter the rated CFM and pressure for the existing air compressor(s).
  - For "Control Method," enter Load/No Load, Inlet Modulation, variable displacement, or VSD.
  - For "Inappropriate Use Airflow (CFM)," enter the CFM of the compressed air system that goes to the inappropriate use.
- Replace inappropriate use of compressed air (e.g., blow off, cooling, air motors, etc.) with a blower or electric motor.
- Compressed air load shifting incentive is for existing buildings only.
- Inappropriate use must have an annual runtime of at least 2,000 hours.
- Incentive will be calculated as follows: (Compressed Air HP for the inappropriate use - HP for the replacement technology) x Incentive Rate per HP from table below.
- Reservation code is required. Call 800.762.7077 before you start your project. Indicate reservation code on application. Applications received without a reservation code will not be eligible.
- Focus on Energy reserves the right to complete a pre-inspection prior to issuing a reservation code.
- Incentive is limited to 50% of project cost.

<table>
<thead>
<tr>
<th>Measure Description</th>
<th>Code</th>
<th>Incentive</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Install Blower or Electric Motor to Replace Inappropriate Use of Compressed Air</td>
<td>PS2848*</td>
<td>$200</td>
<td>Compressor HP Shifted</td>
</tr>
</tbody>
</table>

* Supplemental Data Sheet needed

PRO TIP

Inappropriate uses potentially include: clean up, cooling, sparging, aspirating, padding, open-tube vortex coolers without thermostats, air motors, air pumps or vacuum generation.
For more information, call 800.762.7077 or visit focusonenergy.com
STEAM AND HOT WATER SYSTEMS
STEAM TRAP MAINTENANCE AND REPAIR

General Requirements: Only natural gas equipment is eligible for incentives. Steam fueled by electric, propane or oil is NOT eligible for incentives. Municipal steam systems (i.e., “city steam”) are not a qualifying utility and are not eligible.

Requirements:

- Repair incentive is only available for the repair or replacement of traps that have malfunctioned and are leaking steam. Repair incentive is not available for traps that are failed closed or are plugged.
- For HVAC process steam traps, use the HVAC/Plumbing Incentive Catalog.
- Repairs do not need to be made at one time, but only one repair incentive per trap can be applied for in a year.
- Mass replacement of traps can be completed without condition assessment. Focus on Energy will assume that 20% of traps were leaking and pay a repair incentive for 20% of the total traps replaced and no survey incentive.
- Steam trap survey and repair work must be recorded in a log sheet and attached to the application in order to be eligible for the survey incentive. Vendor must create and fill in the log as work is completed. Required fields (minimum):
  - ID Tag Number
  - Location Description
  - Nominal Steam Pressure
  - Trap Type
  - Indicate Condition (check ONE):
    - Functioning Properly
    - Malfunctioning - Not Leaking Steam
    - Malfunctioning - Leaking Steam
  - Survey Date/Repair Date
  - Survey/Repair Technician Name
  - Orifice Size (if repaired or replaced)
  - Notes

- Surveys are optional. A customer may apply for the repair incentive only to repair or replace known failed steam traps. Survey incentives are available only once per year per steam system.
- To qualify for the survey incentive, customer must repair or replace one trap for every five traps surveyed. If less than one trap per every five traps surveyed is identified as failed, then all failed traps must be repaired or replaced. In the case where all identified failed traps must be repaired or replaced, customer can provide written explanation for a trap that cannot be repaired or replaced and may still qualify for a custom incentive.

**General Requirements:** Only natural gas equipment is eligible for incentives. Boilers fueled by electric, propane or oil are NOT eligible for incentives. Redundant or backup boilers do not qualify.

**PROCESS BOILER COMBUSTION UPGRADES**

**Requirements:**
- Complete Table E of the "Process Systems Incentive Catalog Supplemental Data Sheet" for this measure.
- Incentives are available for process boilers only where the boiler is used to provide a hot water or steam load to a process end use. For boilers that are used for HVAC space heating, use the boiler combustion upgrade measures in the HVAC/Plumbing Incentive Catalog.
- Boiler must be natural gas-fired, forced draft that operates a minimum of 2,000 hours per year.
- Installation of redundant or backup boiler combustion equipment does not qualify for an incentive.
- Boiler input must be entered in boiler horsepower (BHP). 1 BHP = 33.476 MBh.
- High turndown burner must be able to provide efficient combustion at a 10:1 turndown ratio.
- **Incentive is capped at 50% of project cost** not including any internal labor. Invoices must be attached and include the manufacturer name and model number of linkageless controls, O₂ trim and high turndown burner equipment.

VARIABLE FREQUENCY DRIVES
**VARIABLE TORQUE VFDs**

**Requirements:**
- Complete Table F of the "Process Systems Incentive Catalog Supplemental Data Sheet" for this measure.
  - For the "VFD Application," enter Chilled Water Distribution Pump, Process Pump, Boiler Draft Fan, Cooling Tower Fan or Process Fan. If you are unsure of the application of your VFD, please contact Focus on Energy for assistance.
  - For the "Controls Before VFD," enter Outlet Control Valve, Bypass Valve, Discharge Damper, Inlet Guide Vanes, On/Off or Other and then describe.
- The system using the VFD must operate a minimum of 2,000 hours annually.
- The system using the VFD may not exceed 500 HP.
- VFD speed must be automatically controlled by differential pressure, flow, temperature or other variable signal.
- VFD must be installed on a centrifugal or axial flow pump or fan, i.e., a variable torque load. VFDs may not be beneficial in pump systems where static head makes up a large portion of the total system head. Be sure to understand these aspects of your system and discuss them with the equipment vendor in advance of applying VFD technology.
- Staged air volume systems (using a VFD to achieve two-speed fan control on a rooftop unit) are not eligible, but may qualify for a custom incentive.
- Refer to HVAC/Plumbing Incentive Catalog for HVAC pumps and fan. VFDs added to chillers and air compressors do not qualify for this incentive.
- For VSD vacuum pumps ≤ 30 HP, see Compressed Air and Vacuum section of this catalog. VSD vacuum pumps > 30 HP may qualify for a custom incentive.
- For dairy systems vacuum pumps, refer to the Agribusiness Incentive Catalog.

CONSTANT TORQUE VFDs

Requirements:

- Complete Table G of the "Process Systems Incentive Catalog Supplemental Data Sheet" for this measure.
- Only constant torque VFDs for existing building applications are eligible for incentives below. Use of constant torque VFDs for new construction may qualify for custom incentives.
- VFDs must be installed on constant torque equipment (e.g., conveyors, positive displacement pumps, extruders, mixers, crusher/shredders). VFDs installed on a centrifugal or axial flow pump or fan, i.e., a variable torque load should use the Variable Torque VFD offer on page 28. If neither offer is applicable, the project may qualify for a custom incentive.
- The system using the VFD must operate a minimum of 2,000 hours annually.
- The system using the VFD may not exceed 500 HP.
- VFD speed can be automatically controlled by differential pressure, flow, temperature or other variable signal, or be manually controlled.
- Air compressors are not eligible for this offer. Instead, use the Variable Speed Drive Air Compressors on page 15.
- For VSD vacuum pumps ≤ 30 HP, see Compressed Air and Vacuum section of this catalog. VSD vacuum pumps > 30 HP may qualify for a custom incentive.

<table>
<thead>
<tr>
<th>Measure Description</th>

<th>Incentive</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Constant Torque VFD</td>
<td>PS3280*</td>
<td>$30</td>
<td>HP</td>
</tr>
</tbody>
</table>

* Supplemental Data Sheet needed

PRO TIP

Constant torque loads are defined as the torque requirement being constant at all speeds. Equipment such as cranes, hoists, conveyors or mixers are constant torque. Constant torque power varies linearly with speed.

PRO TIP

The power requirement of the fan or pump varies as the third power of the speed ratio. Therefore small decreases in speed by using a VFD will result in large savings.
For more information, call 800.762.7077 or visit focusonenergy.com
DATA CENTER AND TELECOM FACILITIES
**DATA CENTER AND TELECOM COOLING ≤ 5.4 TONS**

**Requirements:**
- Incentive is for the installation of high-efficiency split system air conditioning equipment ≤ 5.4 tons (65,000 BTU/h). Rated AHRI efficiency must meet or exceed minimum SEER ratings shown.
- AHRI verified cooling capacity and SEER will be used to calculate the incentive.
- Mini-split/ductless systems that meet these efficiencies and are listed in AHRI with matching indoor unit and outdoor unit configuration also qualify.

DATA CENTER AND TELECOM AIR SIDE ECONOMIZER

Requirements:
• Complete Table H of the "Process Systems Catalog Supplemental Data Sheet" for this measure.
  • The "Economizer Shutoff Temperature" is the temperature above which the economizer is disabled.
  • The "Supply Air Temperature" is the temperature of cool air leaving the air handler.
  • The "Cooling System EER" is the efficiency at AHRI conditions.
  • If the cooling system does not have a cooling tower, enter "N/A" in columns related to cooling towers.
• This incentive is for the installation of an air-side economizer to offset electric cooling in a data center, telecom facility, or similar facility that has a 24/7 cooling load that does not already have some air-side economizer functionality.
• Air-side economizer must be automatically controlled based on outside air temperature or enthalpy.
• Redundant and backup cooling equipment does not count towards the total tons of cooling.
• Process loads in manufacturing facilities are not eligible.
• Air side economizer limited to offsetting ≤ 100 tons of mechanical cooling. Custom incentives may be available for larger systems.

ENERGY-EFFICIENT DRYCOOLER FOR DATA CENTER AND TELECOM

Requirements:
• Complete Table I of the "Process Systems Catalog Supplemental Data Sheet" for this measure.
  • Install a water-side economizer that is automatically controlled to enable economizer operation based on outside air temperature.
  • Water-side economizer must be installed new and is not for replacement of an existing water-side economizer.
  • Only for data centers and telecom facilities with direct expansion (DX) computer room air conditioning (CRAC) units. (Drycoolers for chilled water systems may be eligible for custom incentives.)
  • Redundant CRAC units that are not in operation do not count toward the total capacity (i.e., the total capacity of redundant, non-operational CRAC units should not be included when calculating the total capacity).
  • Provide documentation of total rated capacity of data center cooling system. Documentation should include an inventory of CRAC units with quantity, capacity, manufacturer and model number of each unit.

**General Requirements:** Uninterruptible Power Supply (UPS) or rectifier must be installed in a data center, telecom facility, or similar space that has computer, router, switch or similar IT equipment. UPS systems for individual desktop computers or critical manufacturing loads are not eligible.

**UPS AND RECTIFIER UPGRADES**

**Requirements:**
- Complete Table J of the "Process Systems Catalog Supplemental Data Sheet" for this measure.
  - The kW for the incentive is the kW of IT equipment load (i.e., output of the UPS or rectifier).
  - Efficiency for new UPS (should be based on tests done in accordance with Department of Energy 10 CFR 430).
  - For "cooling system," list the type of equipment used for cooling, such as: DX, air cooled chiller, water cooled chiller.
  - For "cooling system efficiency," account for any auxiliary equipment like pumps and cooling tower fans.
- Efficient UPS and rectifier systems must be ≥ 94% full load efficiency. Provide a spec sheet to confirm efficiency of the new UPS or rectifier.
- The UPS or rectifier system being replaced must be ≤ 90% efficient at current IT load. Provide a spec sheet, metered data, or screen shots of UPS or rectifier controls to confirm existing UPS or rectifier efficiency.

PROCESS AND SPECIALTY EQUIPMENT
# Radiant Heater Bands

**Requirements:**
- Complete Table K of the "Process Systems Incentive Catalog Supplemental Data Sheet" for this measure to provide metered data if available.
- Must be used on plastics equipment including injection molding, profile and sheet extrusion and blow molding.
- For replacement of standard conduction band heaters on plastic forming machine barrels with radiant barrel heaters.
- Replacement of existing radiant heater bands with more efficient radiant heater bands may qualify for a custom incentive.
- Incentive is limited to 50% of the project cost.

ENERGY-EFFICIENT BATTERY CHARGERS

Requirements:

- Complete Table P of the "Process Systems Incentive Catalog Supplemental Data Sheet" for this measure.
- The charger must meet the California Energy Commission’s 2016 Appliance Efficiency Regulations for Large Battery Chargers. Approved products are listed online at cacertappliances.energy.ca.gov/Pages/ApplianceSearch.aspx.
- Incentive is per kW-hour (1,000 watt-hours) of battery charger capacity.
- Use battery capacity in kW-hour from the qualified products list, unless actual battery capacity (kW-hour or watt-hours) is significantly different. If significantly different, use the following formula to calculate kW-hour capacity for a given charger: one hour Ah rating x battery voltage x time to charge/1000 W/kW. If time to charge is unknown, use 8 hours.
- The charger must operate at least 1,000 hours per year.
- The charger must replace (or be installed instead of) a ferroresonant, silicon controlled rectifier (SCR) or hybrid ferroresonant/SCR battery charger.
- This measure is intended for battery chargers for mobile material handling equipment such as forklifts, pallet jacks and lifts that are used at a commercial or industrial facility. It is not intended for chargers designed for electric or hybrid / electric vehicles to be driven on public roads and highways.

* Supplemental Data Sheet needed
General Requirements: Eligible process exhaust filtration projects must reduce or eliminate existing, heating-only make-up air for process exhaust. Make-up air must be natural gas-fired and served by an eligible natural gas utility. An eligible electric utility is not required for Process Exhaust Filtration measures.

PROCESS EXHAUST FILTRATION

Requirements:
- Complete Table Q of the "Process Systems Incentive Catalog Supplemental Data Sheet" for this measure.
- Make-up air systems that also provide cooling or projects that offset the need for additional make-up air (including new construction projects) may qualify for a custom incentive.
- System must operate at least 2,000 hours annually.
- Filtration must be applied to a manufacturing process. Commercial HVAC applications are not eligible.
- Filtration system must reduce or eliminate the need for process exhaust by filtering and recirculating the air and thereby reducing or eliminating make-up air demand and associated heating energy.
- Incentive is limited to 50% of project cost.
- Reservation code is required. Indicate reservation code on application. Applications received without a reservation code will not be eligible. Call 800.762.7077 to speak with a program representative before you start your project.
  - Focus on Energy reserves the right to complete a pre-inspection prior to issuing a reservation code.

<table>
<thead>

<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process Exhaust Filtration</td>
<td>PS3244*</td>
<td>$0.55</td>
<td>CFM Reduced</td>
</tr>
</tbody>
</table>

* Supplemental Data Sheet needed

PRO TIP
Reducing exhaust by installing filtration can help reduce energy costs by reducing make-up air and exhaust requirement, on average $5/CFM annually. It can also help correct air balance in the building.
Focus on Energy requires a copy of your itemized invoice to process incentives. Use this example to help guide you through our invoice requirements.

Only registered Trade Allies can receive incentive payments on behalf of their customers. If submitting a purchase order, submit an invoice as well. **Purchase orders alone are not sufficient documentation.**

If you are a Focus on Energy registered Trade Ally receiving the incentive, you must show the credit to the customer on your invoice.

Thank you for your business!
Acronyms, abbreviations and technical terms used throughout this catalog are defined below.

**ACRONYMS AND ABBREVIATIONS**

- **AHRI**: Air Conditioning, Heating and Refrigeration Institute
- **ASHRAE**: American Society of Heating, Refrigerating and Air-Conditioning Engineers
- **BHP**: Brake Horsepower
- **BTU**: British Thermal Unit
- **BTU/HR**: British Thermal Unit Per Hour
- **CAGI**: Compressed Air and Gas Institute
- **CFM**: Cubic Feet Per Minute
- **DOE**: Department of Energy
- **EER**: Energy Efficiency Ratio
- **HP**: Horsepower
- **HVAC**: Heating, Ventilation and Air Conditioning
- **IT**: Information and Technology
- **kW**: Kilowatts
- **kWh**: Kilowatt-hours
- **MBh**: 1,000 Btuh
- **PSIA**: Pounds Per Square Inch Absolute
- **PSIG**: Pounds Per Square Inch Gauge
- **SCFM**: Standard Cubic Feet Per Minute
- **VFD**: Variable Frequency Drive
- **VSD**: Variable Speed Drive

**GLOSSARY TERMS**

**Air Compressor**
A device that uses mechanical energy to compress gases, such as air, to a higher pressure.

**Air-Entraining Nozzle**
Both handheld and fixed air nozzles use compressed air to clean or dry things. In comparison, an air-entraining nozzle uses less compressed air to do the same work by grabbing or entraining surrounding atmospheric air, making it a more efficient option.

**Air Motor**
A device in which the pressure of confined air causes the rotation of a rotor or the movement of a piston.

**Amp**
Short for ampere and in plural is called amps.

**Aspiration**
The act of removing a fluid from a cavity.

**Axial Fan**
Fan that moves air in the general direction of the axis about which it rotates.

**Blow Molding**
A type of plastic extrusion where molten plastic is extruded through a die head to form a hollow tube and dropped into a mold. The tube of plastic is then inflated. The inflated plastic cools in the mold, and the mold is opened to reveal the plastic part.

**Blower**
A blower is a type of air compressor that delivers moderate pressure air.

**British Thermal Units (BTUs)**
A measurement of energy. The amount of heat required to raise the temperature of one pound of water 1 degree Fahrenheit at or near 39.2 degrees Fahrenheit at standard atmospheric pressure.

**British Thermal Units Per Hour**
The number of BTUs consumed or generated in a one-hour period.

**Burner Efficiency**
The percentage of heat input to the burner that is used for useful work.

**Burner Heat Rate**
The rate of heat at which a burner is specified to operate, typically measured in BTU/HR.

**Centrifugal Air Compressor**
A type of dynamic air compressor where a continuous flow of air has its velocity raised in an impeller rotating at a relatively high speed.

**Centrifugal Fan or Pump**
Fan or pump where the air or water enters the impeller axially and leaves it substantially in a radial direction.

**Coalescing Filter**
A compressed air filter that removes water and aerosols by collecting and joining particulates and removing them from the compressed air system. These can become saturated with liquid in operation thus making mist eliminators a better option.

**Compressed Air and Gas Institute (CAGI) Data Sheet**
A data sheet that provides a standardized format for manufacturers to provide basic information and performance of a compressor. See cagi.org/performance-verification/data-sheets.aspx for more information.

**Compressed Air Operated Vortex Coolers**
A device that has no moving parts but separates compressed air into cold and hot air streams and is often used for cooling cutting tools.

**Compressed Air Storage**
Storage of compressed air that can be used to meet demand fluctuation and limit on/off cycling of constant speed air compressors.
GLOSSARY TERMS, CONTINUED

Constant Torque
Torque requirement is constant at all speeds. Equipment such as cranes, hoists, conveyors and mixers are constant torque. Constant torque power varies linearly with speed.

Cubic Feet Per Minute
This measurement indicates how many cubic feet of air pass by a stationary point in one minute. The higher the number, the more air is being forced through the ductwork by the system.

Cycling Refrigerated Air Dryer
A thermal mass such as glycol or metal that is used to cool and dry air. The thermal mass is temperature controlled by a thermostat so that the refrigerant compressor shuts off at reduced loads.

Damper
An element that is inserted into an air-distribution system or element of an air-distribution system permitting modification of the air resistance of the system and consequently changing the airflow rate or shutting off the airflow.

Deliquescent Air Dryer
Compressed air dryer that uses a material with a high affinity for water. The water is absorbed by the material. The material eventually needs to be replaced once the material is fully dissolved into liquid.

Desiccant Air Dryer
Compressed air dryer which uses material that adsorbs water. The water can be driven off the material by applying dry purge air, heat or both.

Dew Point
Temperature at which water vapor has reached the saturation point (100% relative humidity).

Drain
Various types of drain traps in a compressed air system used to remove condensate. They can be found at various places in the compressed air system such as intercoolers, aftercoolers, filters, dryers, receivers or at points of use.

Extrusion
A manufacturing process used mainly in plastics manufacturing. Molten plastic is forced out of a die of desired size.

Heat of Compression Air Dryer
Compressed air dryer that uses the heat generated during compression to dry the desiccant material.

High Efficiency Side Entry Agitator
An engineered and specifically built impeller to replace the standard marine type impeller for a side entry agitator that is commonly used in stock blending and mixing tanks.

Horsepower
A unit of power used for motors, approximately equal to 0.746 kW.

Injection Molding
A manufacturing process used mainly in plastics manufacturing. Molten plastic is injected into a mold to create a part.

Inlet Modulation
A method of control for rotary screw air compressors where an inlet damper is partially closed to provide capacity modulation at part-load operation.

Kilowatt-hours
A unit of measurement for electrical energy usage. One kilowatt hour equals 1,000 watts of energy used for one hour.

Kilowatts
A unit of electrical power equivalent to 1,000 watts.

Injection Molding Screw and Barrel
Part of the injection molding press. The barrel is where the plastic is heated and melted. The screw is used to force the plastic into the mold.

Load / No Load Air Compressor
Capacity control for reciprocating air compressors – when the upper pressure seating is reached, valve unloaders hold open the inlet valves so that air drawn into the cylinder is expelled through the open inlet valves with any compression or delivery taking place. During unloading times, the compressor is still drawing power. On/off control differs in that the compressor starts and stops based on preset pressures and the compressor does not use power when stopped.

Make-Up Air
Air used to replace exhausted air to maintain building pressure balance.

Manual Drains
An operator manually opens valves to discharge condensate from a compressed air system.

Membrane Air Dryer
Membrane pores allow water vapor to pass through the pores faster than the compressed air which draws water out of the compressed air stream.

Mist Eliminator
A type of coalescing filter with a lower pressure drop (~1 psig) across the filter than a standard coalescing filter.

Nominal HP
Nameplate power of a motor.

On/Off
Type of compressor control that starts and stops the compressors based on a pre-set pressure.

Pounds Per Square Inch Absolute
A measurement of pressure. The force exerted on a surface in a fluid or gas measured relative to the absolute zero pressure – the pressure that would occur at absolute vacuum.

Pounds Per Square Inch Gauge
A measurement of pressure. The force exerted on a surface in a fluid or gas measured by a gauge relative to the surrounding atmosphere.

Pressure Header
A set of main pipes that delivers air from the compressor room.

Pressure Screen Rotor
A dual element foil rotor that efficiently removes contaminants from recycled paper.

Pressure/Flow Controllers
A device that separates the supply and demand side of a compressed air system.

Radiant Heater Bands
A series of radiant heaters embedded in ceramic insulation that is wrapped around the barrel of injection molders and extruders. These allow for more efficient heating than normal barrel heating.

Radiant Tube Insert
A ceramic insert for radiant tubes used in heat-treating furnaces. The insert provides a higher rate of heat transfer in the burner tube by producing nonturbulent and high-convection flow which reduces energy consumption of the furnace.

Rated SCFM
The nameplate flow of the air compressor or blower.
Repulper Rotor and Extraction Plate
A mixing system for defibered dried pulp bales for use in paper making. Manufacturers have recently redesigned repulper rotors making them energy-efficient. The extraction plate allows for the fit of the new rotor to the existing system.

Rooftop Unit
An air handling unit designed for outdoor use and usually installed on roofs.

Rotary Vane Compressor
A type of positive displacement air compressor.

Screw Compressor
A type of air compressor that is a positive displacement type which means that a given quantity of air is trapped in a compression chamber and the space that is occupied is mechanically reduced.

Soft Start
A type of device used to reduce the in-rush current of a motor during start-up.

Sparging
To agitate (a liquid) by means of compressed air or gas entering through a pipe.

Spline Rotor Upgrade for Refiners
Refiners are upgraded with spline technology to allow the splined rotor to balance on a splined hub, which is mounted to a non-floating fixed shaft. This improves the rotor centering which in turn increases the refiner efficiency and performance.

Static Head
The difference in elevation in which a fluid is to be pumped, typically measured in feet.

Static Pressure
The pressure associated with lifting the fluid to the static head height.

Steam Trap
Steam traps are automatic valves used in every steam system to remove condensate, air and other noncondensable gases while preventing or minimizing the passing of steam. If condensate is allowed to collect, it reduces the flow capacity of steam lines and the thermal capacity of heat transfer equipment.

Total System Head
The static head of a pumping system plus the frictional head of the system, typically measured in feet.

Vacuum Pump
A mechanical device that removes gas from a volume to create a vacuum.

Variable Displacement
Capacity control for rotary air compressors that uses a valve that is built into the compressor casing to control output to match demand by varying the displacement of the rotors.

Variable Frequency Drive (VFD)
An electronic controller that adjusts the speed of an electric motor by modulating the power being delivered. VFDs provide continuous control, matching motor speed to the actual demands of the pump, fan or motor system. Motor speed fully modulates as the frequency of the alternating current is adjusted by the VFD.

Variable Speed Drive
Often used interchangeably with VFD. These drives are often used on smaller motors, direct current (DC) motors and multiple speed motors that do not need full modulation.

Variable Torque
Torque requirement changes at different speeds. Equipment such as centrifugal pumps and fans are variable torque.

Voltage
The difference in electric potential energy measured in volts.

REDUCING ENERGY WASTE ACROSS WISCONSIN

FOCUS ON ENERGY®, Wisconsin utilities’ statewide program for energy efficiency and renewable energy, helps eligible residents and businesses save energy and money while protecting the environment. Focus on Energy information, resources and financial incentives help to implement energy efficiency and renewable energy projects that otherwise would not be completed.

©2020 Wisconsin Focus on Energy
